

#This is a note regarding the modification of GRUB menu.

The main file which contains the details of the menuentries and everything is `/boot/grub/grub.cfg`

This file gets the settings from `/etc/default/grub` and templates from `/etc/grub.d`

In `/etc/grub.d` there are a bunch of executables which update the `/boot/grub/grub.cfg` file on firing `update-grub` command.

The menuentries are formed from those executables. If you have to remove a menuentry, simply `remove the executable permission` for the template corresponding to that menu entry.

With remaining menu-entries, fire `update-grub`, then go the `/boot/grub/grub.cfg` file and make some more changes such as renaming the entries, or removing sub-menus. When done, `don't fire update-grub`, but simply save the file and you are done.
